A. INTRODUCTION

The California Multi-Agency CIP Benchmarking Study (Study) is a collaborative effort that involves the sharing of ideas and data between several of the largest cities in California. This report presents the findings of several key components of the study: performance benchmarking, best management practices (BMPs), and the online discussion forum.

Performance benchmarking is conducted to establish relationships between project delivery costs and total construction cost (TCC). The Study examines how these relationships change over a five-year trailing period. This is a core concept of the Study that provides a meaningful benchmark by which participating agencies can assess their project delivery performance and identify potential reasons for differences between them and peers.

Best management practices are discussed and tracked to provide participating agencies a living archive of practices being implemented by peers, lessons learned through their implementation, and potential benefit to be derived if implemented.

The online discussion forum is a concept developed out of the Study that provides a convenient setting for participating agencies to present topics and/or questions for which they would like input from peers. It is an extension of regularly conducted face-to-face meetings to further discussion.

A brief overview of these Study components is presented in this executive summary.

B. PERFORMANCE BENCHMARKING

The project data submitted by the agencies are compiled in a customized Microsoft Access® database. This database serves as a repository for the data collected since the inception of the Study. Each year, the project database is updated with the inclusion of project data submitted for that Study year and updated project data submitted for previous years. The Update 2016 database includes a total of 602 projects, 481 of which belong in the 80th percentile subset by TCC.

Project Delivery Costs by Project Type

Table 1-1 summarizes project delivery cost as a percentage of TCC by each of the four project types in the Study for the full range of TCC. Table 1-2 similarly summarizes project delivery cost as a percentage of TCC for the smaller 80th percentile projects based on TCC. The project delivery percentage for a category is the arithmetic average of the project delivery percentages of the individual projects grouped under that category.
Table 1-1

Notes:
1. Project Delivery percentages represent arithmetic averages of the individual projects and do not represent the results from the regression analyses.
2. Project Delivery percentages vary from year to year based on the selection and the composition of the projects in the database.
3. Total excludes projects delivered by alternative delivery mechanisms such as a design-build, JOC, and CM@Risk. Projects delivered by alternative techniques are retained in the database but not analyzed. These projects are not included in the projects selected for analysis in the Study.

</tbody>
</table>

Notes:
1. Project Delivery percentages represent arithmetic averages of the individual projects and do not represent the results from the regression analyses.
2. Project Delivery percentages vary from year to year based on the selection and the composition of the projects in the database.
3. Total excludes projects delivered by alternative delivery mechanisms such as a design-build, JOC, and CM@Risk. Projects delivered by alternative techniques are retained in the database but not analyzed. These projects are not included in the projects selected for analysis in the Study.
Regression Analysis
A regression analysis was performed to understand the relationship between project delivery as a percent of TCC. This analysis is important to establish statistical significance related to the performance benchmarking. The results reflect the agencies’ experience with the delivery of capital projects; on a percentage basis projects with lower TCCs are more expensive to deliver than projects with higher TCCs. Results from the regression analysis methodology are discussed in Appendix B.

Project Delivery Percentages as Ranges of TCC
In addition to evaluating a subset of projects defined by the lower 80th percentile subset, the project team evaluated the project delivery percentages on further subsets. An analysis was performed on how the project delivery percentage would change if the projects were categorized by TCC cost ranges.

The results show how the project delivery percentage changes for different ranges of TCC of projects. Projects with higher TCC typically have lower project delivery percentages of TCC and projects with lower TCC typically have a higher project delivery percentage of TCC. The results are further discussed in Chapter 3.

C. BEST MANAGEMENT PRACTICES
At the start of this Study in 2002, the agencies examined over 100 practices used in project delivery. Many practices included those the participants did not commonly use at the time, but believed could add value if ultimately implemented as Best Management Practices (BMPs). Each year the agencies look at industry changes in order to identify new BMPs. Each Agency’s implementation of these selected practices will continue to be tracked. No new BMPs have been developed in Update 2016, although the agencies are continuing to track the performance on the already developed BMPs.

While a BMP may be developed to address a specific issue, its implementation may affect other elements of project delivery. The participating agencies judged that each of the BMPs favorably impact one of the following categories:

- Cost
- Schedule
- Quality
- Communication
- Environment
- Customer Service

These BMPs continue to be an important element of the Study by providing a reference for participating agencies to identify additional BMPs that may be beneficial to implement or to understand challenges associated with their implementation. The discussion on BMPs is found in Chapter 4 of this report.
D. ONLINE DISCUSSION FORUM

The following discussion topics are summarized in the Chapter 5 Online Discussion Forum.

- Infrastructure Asset Management Survey
- Slurry Seal Materials
- Municipal Streets
- Detectable Warning Tiles

An archive of the full discussion forum is posted confidentially on the Study website for access by the participants.

E. ACKNOWLEDGEMENTS

This Study is made possible through the generous contributions of each participating agency, city staff, and consultants. Contributors include:

- City of Long Beach/Port of Long Beach
- City of Los Angeles
- City of Oakland
- City of Sacramento
- City of San Diego
- City of San Francisco
- City of San José
- MWH Americas, Inc.
- Skanska USA Building, Inc.
- William Lacher

A full list of acknowledgements is presented in Chapter 6.
Chapter 2
Introduction
The California Multi-Agency CIP Benchmarking Study (Study) is a collaborative effort that involves the sharing of ideas and data between several of the largest cities in California. Each participating member contributes to the discussion of lessons learned out of their capital improvement program (CIP) implementation. Through this framework, members of the Study wish to: increase efficiency in delivering services, employ best management practices (BMPs), implement continuous training programs, and develop best-in-class capabilities.

The Study provides a forum for the agencies to share information among themselves via meetings that focus on current issues; an online portal where topics for discussion can be posed and challenges addressed; and a database that serves as both a repository of the agencies’ projects and a tool for data analysis. The purpose of this collaboration is to share the best ideas of the group for the benefit of all and to gather insight on how to address challenges that might appear to be new, but which others have already faced and addressed successfully.

A. BACKGROUND

In October 2001, the City of Los Angeles, Department of Public Works, Bureau of Engineering initiated the Study with several of the largest cities in California. These cities joined together to form the Project Team for the Study. The Project Team acknowledges that there have been significant benefits derived from collaborating and pooling their project delivery knowledge and experience since the inception of the Study.

The participating agencies currently include:

- City of Long Beach, Department of Public Works and Harbor Department Port of Long Beach
- City of Los Angeles, Department of Public Works, Bureau of Engineering
- City of Oakland, Public Works Department, Bureau of Engineering and Construction
- City of Sacramento, Department of Public Works and Department of Utilities
- City of San Diego, Public Works Department, Engineering and Capital Projects Department
- City and County of San Francisco, Department of Public Works, Building Design and Construction, Infrastructure Design and Construction
- City of San José, Department of Public Works and City Manager’s Office
While the participating agencies have many similarities in terms of function and capital program delivery, it is important to note that a number of factors create differences. Some of these include organization and cost structure. This is reflected in the “Indirect Rates Applied to Capital Projects” table shown in Appendix C. Variances amongst the agency indirect rates can create measurable delivery cost differences between the agencies for similar projects. However, the large magnitude of projects in the Study database has normalized these differences when data is compiled for major project categories and/or across all project types.

Upon initiation of the Study, it was agreed that published data provided by Study participants should remain anonymous in order to create a positive, non-competitive team environment, conducive to meeting the Study’s goals.

General information on each participating agency is summarized on Table 2-1.

**B. BENEFITS OF PARTICIPATION**

The participating agencies have been very supportive of the Study efforts over the years. The Study is possible only because the agencies believe they are benefiting from their continued participation.

The agencies have expressed many benefits of the Study. Ready access to performance data and BMPs of the largest cities in California helps member agencies in their decision-making process regarding policy and procedural improvements while providing training initiatives for new project managers. Sharing project delivery costs provides agencies a higher level of design and construction estimate certainty and a benchmark to assess their individual CIP implementation performance. The tracking and reporting of the Study provides a structured framework for agencies to more seamlessly correlate performance with that of the collective.

The Study, through regular meetings and the online forum, facilitates the discussion of how executives from each agency are managing and meeting similar challenges. Meetings involve the discussion of timely subjects that prepare agencies in addressing coming issues. The Study helps agency staff better communicate typical CIP challenges, e.g., needed resources, with elected officials and community stakeholders.

### C. STUDY FOCUS

This year, the participating agencies devoted in-person meeting time to collaborating with each other on pressing issues facing all the agencies. Agency implementation of selected BMPs has been and will continue to be tracked during the Study. A description of the newly added BMP along with their “Perceived Value” is presented in Chapter 4, Best Management Practices.

### D. STUDY GOALS

The Study method is described in detail in the first Study report (published in 2002) and modifications to it have been documented in subsequent Study reports.
In Update 2016, the agencies made progress on several goals:

1. **Collect projects delivered by alternative delivery techniques in the performance database.** Over the years, the participating agencies have executed several projects using alternative delivery methods such as design-build and job-order-contracting yielding benefits in areas such as cost, schedule, and overall project delivery. In order to capture such projects as part of the *Study*, the agencies have decided to collect cost data for projects delivered via alternative methods. This practice was initiated in Update 2011 and continued in Update 2016. However, the agencies decided that these projects would not be analyzed until a sufficient number of projects are collected to facilitate meaningful analyses. In addition, criteria for analysis for projects delivered by alternative delivery techniques needs to be defined. The performance questionnaire to collect project information will be updated in Update 2017 to better categorize alternative delivery projects.

2. **Track the adoption of BMPs.** The Project Team continued to track the implementation of BMPs in order to link these practices to project delivery performance improvement over time in order to encourage their implementation. The Project Team continued to discuss common challenges and share ideas for addressing those challenges during the quarterly meetings. Although no new BMPs were adopted for Update 2016, agencies focused on specific challenges implementing BMPs already identified.

3. **Continue efficient information sharing with one another through in-person meetings and the online discussion forum.** In Update 2016, the Project Team continued to use an online portal for discussing issues and challenges. The use of the online portal for exchanging ideas and discussing topics of common interest was first started in 2009. The portal allows for efficient archiving of discussion topics and ease of access. The Project Team uses the discussion forum to share information; survey current processes and policies; and collaborate on implementing new processes and policies.

4. **Special study: Project duration.** A special *study* was conducted using historical data to determine the typical duration for a project based on cost ranges. Although results were obtained, it became apparent that the required information was not being collected on the performance questionnaires, leading to the performance questionnaire being updated for *Study* 2017.
Chapter 3
Performance Benchmarking
Performance benchmarking involves collecting documented project costs and plotting the component costs of project delivery against the total construction cost (TCC). The objective of this exercise is to develop relationships between these variables by performing regression analyses. Since Update 2009, the results of the regression analyses have yielded significantly better correlation compared to prior years of the Study. This is primarily due to the adoption of statistical techniques for model selection and significant improvements in the modeling methodology.

The project costs data are collected from the agencies using a Performance Questionnaire created in Microsoft Excel®. Data are then compiled from the questionnaires in Excel® using a Visual Basic for Applications (VBA) code where the data is reviewed and vetted, and then transferred into the database. A copy of the current Performance Questionnaire can be found in Appendix A.

Note that the values presented in tables for previous years in this Update 2016 Benchmarking Report may have changed from prior reports due to the addition or update of past projects.

A. STUDY CRITERIA

The following criteria applied to Update 2016 performance benchmarking analyses:

- **Total Construction Cost** – TCC is the sum of costs associated with the awarded construction contract, net change orders, utility relocation, and construction by agency forces. TCC does not include the cost of land acquisition, environmental monitoring and mitigation, design, or construction management. All projects included in the analyses have a TCC exceeding $100,000. The participating agencies use fully-loaded (direct and indirect) costs for project delivery tasks. (See Appendix C).

- **Completion Date** – Projects included in the Study analyses were completed on or after January 1, 2011 and before December 31, 2015. Projects with earlier or later completion dates were kept in the database, but excluded from the analyses.

- **Outlier Elimination** – Statistical elimination was used to identify outliers in the performance model. The total project delivery percentage of each project in the database was evaluated against all other projects in the same classification. An outlier was identified as a project whose total project delivery percentage was outside the range expressed by the following inequality:

\[ m - 3\sigma \leq x \leq m + 3\sigma \]
where \( m \) is the mean of the project delivery percentages, \( \sigma \) is the standard deviation of the project delivery percentages for all projects in the same classification, and \( x \) is the project delivery percentage of a particular project.

It should be noted that this approach, which was first adopted in Update 2008, allows for the inclusion of more data than in previous years. Previously, other methods including visual inspection were used for the elimination of outlier data points. This change was in part allowed by the improved modeling techniques that have been documented in prior Study reports.

Projects confirmed as outliers by this statistical technique were kept in the database, but excluded from the analyses.

- **Project Delivery Method** – All projects analyzed in this Study were delivered through the traditional design-bid-build method. In prior Study years, project costs data were only collected and analyzed for projects delivered using the traditional design-bid-build method. Over the years, the participating agencies have executed several projects using alternative delivery methods such as design-build and job-order-contracting yielding benefits in areas such as cost, schedule, and overall project delivery. In order to capture such projects as part of the Study, the agencies have decided to collect cost data for projects delivered via alternative methods. However, the agencies decided that these projects will not be analyzed until a sufficient number of projects are collected to facilitate meaningful analyses.

- **Change Order Classification** – To support meaningful change order analyses, the Project Team reported change orders in accordance with the following classifications:
  1. Changed/Unforeseen Conditions
  2. Changes to Bid Documents
  3. Client-Initiated Changes

- **Project Classifications** – Sixteen project classifications grouped into four project types are used in this Study. In Update 2008, two new project classifications, “Other Municipal Facilities” and “Other Pipes” were added to the Municipal and the Pipes projects categories, respectively. These two classifications will include projects that do not fall under the existing Municipal and Pipes classifications but are representative of the Municipal and the Pipes categories. The agencies will continue to collect data for these classifications for future analyses. The project types and classifications are shown in Table 3-1.
Table 3-1

</tr>
</tbody>
</table>

Notes:
¹ Projects include design and/or construction activities for parking structures, yards, soil anchors, docks, animal shelters, reservoirs, water treatment plants, piers, and animal services centers.

B. DATA COLLECTION AND CONFIRMATION

To obtain meaningful results from the performance model, it is essential that the data collected from the agencies are accurate and conform to the Study criteria. The agencies recognize the importance of quality input data and are committed to providing accurate, complete project delivery cost data to support the development of performance models. Project delivery costs are defined as the sum of all agency and consultant costs associated with project planning, design, bid, award, construction management, and closeout activities. Examples of specific activities included in each phase of project delivery are presented in Table 3-2.

For the Update 2016 Study, the agencies completed the questionnaires with comparable, complete, and accurate values. The agencies also review and compare their data collection and confirmation techniques on a regular basis. For example, in the second quarterly meeting during Update 2016, each agency completed questionnaires on three previously submitted projects to compare with original submittals. The values obtained were nearly identical, with differences resulting typically from close-out costs that happen years after the project is completed. In addition, discussion among the Project Team helps clarify and resolve inconsistencies in the data collection methodologies. It also ensures that input data is vetted before projects are submitted for analysis.
## Table 3-2

**Project Cost Categories**

<table>
<thead>
<tr>
<th>Category and Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1) Design Costs:</strong></td>
<td>The design phase (and associated costs) begins with the initial concept development, includes planning as well as design, and ends with the issuance of a construction Notice to Proceed. Design costs consist of direct labor costs, other direct agency costs such as art fees and permits, and consultant services cost associated with planning and design. Design may include the following:</td>
</tr>
</tbody>
</table>
| **Planning** | • Complete schematic design documents  
• Review and develop scope  
• Evaluate schedule and budget  
• Review alternative approaches to design and construction  
• Obtain owner approval to proceed  
• Attend hearings and proceedings in connection with the project  
• Prepare feasibility studies  
• Prepare comparative studies of sites, buildings, or locations  
• Provide submissions for governmental approvals  
• Provide services related to future facilities, systems, or equipment  
• Provide services as related to the investigation of existing conditions of site or buildings or to prepare as-built drawings  
• Develop life cycle costs  
• Complete environmental documentation and clearances  
• Monitor and control project costs |
| **Design** | • Complete design development documents including outline specifications  
• Evaluate budget and schedule against updated construction cost estimate  
• Complete design and specifications  
• Develop bid documents and forms including contracts  
• Complete permit applications  
• Manage right-of-way procurement process  
• Coordinate agency reviews of documents  
• Review substitutions of materials and equipment  
• Prepare additive or deductive alternate documentation  
• Coordinate geotechnical, hazardous material, acoustic or other specialty design requirements  
• Provide interior design services  
• Monitor and control project costs |
| **Bid and Award** | • Prepare advertisement for bids  
• Qualify bidders  
• Manage the pre-bid conference  
• Evaluate bids  
• Prepare the recommendation for award  
• Obtain approval of contract award from Board/Council  
• Prepare the Notice to Proceed  
• Monitor and control project costs |
<table>
<thead>
<tr>
<th>Category and Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>2) Construction Management Costs:</strong></td>
<td>All costs associated with construction management, including closeout costs, are included in this category. Construction management costs consist of direct labor, other agency costs, and consultant usage. Construction management may include the following:</td>
</tr>
</tbody>
</table>
| **Construction** | - Hold pre-construction conference  
- Review and approve schedule and schedule updates  
- Perform on-site management  
- Review shop drawings, samples, and submittals  
- Perform lab work, testing, and inspection  
- Process payment requests  
- Review and negotiate Change Orders  
- Prepare monthly reports to owner and agencies  
- Respond to Requests for Information  
- Develop and implement a project communications plan  
- Perform document control  
- Manage claims  
- Perform final inspections and develop and track punch list  |
| **Closeout Phase** | - Commission facilities and equipment  
- Train maintenance and operation personnel  
- Document and track warranty and guarantee information  
- Plan move-in  
- File notices (occupancy, completion, etc.)  
- Check and file as-built documents  
- Monitor and control project costs  |
| **3) Total Project Delivery Costs:** | This is the total cost of delivering a capital improvement project, equal to the sum of the design cost and construction management costs indicated above. |
| **4) Change Order Cost:** | Please see the Update 2005 Report for descriptions of the following types of change orders:  
- Changed/unforeseen conditions - This type of change is necessitated by discovery of actual job site conditions that differ from those shown on the contract plans or described in the specifications. These are conditions a designer could not have reasonably been expected to know about during the design of the project.  
- Changes to Bid Documents - This type of change is necessitated by a mistake or oversight in the original contract documents and is required to correct the plans and specifications.  
- Client-Initiated Changes - This type of change results from additions, deletions or revisions to the physical work. |
C. PERFORMANCE DATABASE

The projects data submitted by the agencies are compiled in a customized Microsoft Access® database. This database not only serves as a repository for the data collected since the inception of the Study, but also allows for data analysis using built-in functions. Each year, the projects database is updated with the inclusion of projects data submitted for that Study year. The analysis and the reporting features of the database are also updated.

Table 3-3 summarizes the number of projects included in the database and in the analyses. The 5-year database used for the current analysis contains 602 projects. This total excludes project data older than five years or projects identified as outliers. Projects identified as outliers are not included in the performance data analysis but are retained in the performance database. In addition, projects delivered by alternative delivery are excluded from the analysis but included in the database. The 602 projects selected for analysis do not include projects delivered by alternative delivery. As explained under subsection A Study Criteria of this chapter, outlier analysis was performed using statistical techniques to ensure consistency in the selection of outlier data points. This methodology was first implemented during Update 2008 and the agencies recognize the merits of a scientific approach for outlier elimination.

This is an improved practice when compared to prior Study years where project data points were classified as outliers based on a combination of statistical parameters and subjective judgments by the Project Team. Previously, projects identified as outliers during one Study phase were kept as outliers in subsequent Study phases.

Table 3-3 shows that as the rules for project selection were refined, the number of non-representative and projects with TCC less than $100K have decreased. In addition, only 16 projects have been excluded as outliers in the Update 2016 Study as compared to the elimination of several hundred projects prior to the refinement of the statistical model in 2009.

In the Study 2002 report, it was recommended that at least 10 projects per classification and a minimum data set of 2,000 projects distributed evenly among classifications, ranges of TCC, and agencies are necessary to achieve statistically-significant results. While over 2,000 projects have been collected in the

<td>5)Total Construction Cost (TCC):</td>
<td>This is the direct construction cost, including all change orders during the construction phase (from the issuance of Notice to Proceed to Notice of Completion). The following costs are associated with construction and are included in the TCC: • Direct actual construction • Total amount of positive change orders throughout construction • Fixtures, furnishing, and equipment (FFE) • Utilities relocation • Construction work performed by the agency’s staff and other agencies’ staff</td>
</tr>
</tbody>
</table>
database, the number of projects analyzed in any Study phase is significantly lower due to the criteria selected for the inclusion of projects in the database. Although the requirement for the minimum number of projects per classification has been met for all project categories, more data needs to be collected to ensure an even distribution of projects amongst all classifications. The agencies acknowledged that it is vital to the success of the Study to continue increasing the size of the data set, thereby increasing the confidence, consistency, and reliability of results. As previously indicated, there are 4 project types (Municipal Facilities, Streets, Pipe Systems, and Parks) and 16 project classifications included in this Study. Table 3-4 summarizes the distribution of projects included in the analyses.

Notes:
1. Total refers to the projects included in the Update 2016 analyses only. Total excludes projects delivered by alternative delivery methods such as a design-build, JOC, and CM@Risk. Projects delivered by alternative methods are retained in the database but not analyzed. These projects are not included in the projects selected for analysis in the Study.
2. Projects include design and/or construction activities for parking structures, yards, soil anchors, docks, animal shelters, reservoirs, water treatment plants, piers, and animal services centers.
D. CHARACTERISTICS OF DATA ANALYZED

Project performance data were analyzed using the custom database application at both the Project Type level and the Project Classification level (see Table 3-1).

Project Count and Project Delivery by Completion Year

Table 3-5 summarizes characteristics of the projects included in the analyses by project completion year and shows trends in the average TCC values, median TCC values, design costs, construction management costs, and overall project delivery costs. The median value is the value at which 50 percent of the values are above and 50 percent of the values are below.

As indicated in Table 3-5, median project size increased between 2011 and 2012. In 2013 the median project size increased by about 34 percent but then decreased by 35 percent between 2013 and 2014, and remained relatively constant from 2014 to 2015. A similar trend is observed in the average project size. The fluctuations may be due to a combination of several factors such as the selection of projects using the five-year window, elimination of projects with high TCC values during the outlier analysis, and the addition of several new projects with low TCC values.

Table 3-5

</tbody>
</table>

Notes:
1. Project Delivery percentages represent arithmetic averages of the individual projects and do not represent the results from the regression analyses.
2. Project Delivery percentages vary from year to year based on the selection and the composition of the projects in the database.
3. Total excludes projects delivered by alternative delivery mechanisms such a design-build, JOC, and CM@Risk. Projects delivered by alternative techniques are retained in the database but not analyzed. These projects are not included in the projects selected for analysis in the Study.
The relatively higher project delivery percentages from projects completed in 2011 to 2013 can be attributed to the “below market rate” bids that were being widely observed in California’s construction sector from 2007 to 2009 due to the recession. Projects that were started during the recession would have been completed in the 2009 to 2013 time period. In addition, factors such as personnel turnover in the agencies have also affected productivity, leading to inefficiencies due to the loss of project specific knowledge. For each project completion year since 2012, project delivery costs as a percentage of the TCC have steadily decreased by 1 to 3 percent annually.

### Project Delivery Costs by Project Type

Table 3-6 shows project delivery costs by each of the four project types in the Study for the full range of TCC. The project delivery percentage for a category is the arithmetic average of the project delivery percentages of the individual projects grouped under that category.

Projects belonging to the Municipal category have the lowest average project delivery percentage. The Pipes category has the highest number of projects (276) in the Update 2016 database. The Pipe and Streets category projects combined total 80 percent of the projects in the database. The Parks and Streets categories exhibit

<table>

Notes:
1. Project Delivery percentages represent arithmetic averages of the individual projects and do not represent the results from the regression analyses.
2. Project Delivery percentages vary from year to year based on the selection and the composition of the projects in the database.
3. Total excludes projects delivered by alternative delivery mechanisms such as design-build, JOC, and CM@Risk. Projects delivered by alternative techniques are retained in the database but not analyzed. These projects are not included in the projects selected for analysis in the Study.
the highest average project delivery cost, and also have the two lowest median TCC. The average project delivery percentage for the overall dataset is 48 percent. These percentages have remained relatively stable for the four project types over previous years.

Over the course of the Study, the agencies have observed that the relatively high average project delivery cost of Streets projects is likely due to increasing cost influences of right-of-way acquisition, community outreach requirements, environmental mitigation requirements, and the smaller median total construction cost of these projects.

Table 3-7 shows project delivery costs by each of the four project types in the Study for the 80th percentile subset of TCC (Note: In Update 2009, the concept of looking at a subset of projects was introduced. This subset generally characterizes the projects in the type or classification being examined. This step was taken as it was generally believed that project delivery for the very large projects did not characterize the overall projects in the type of classification being examined.). The trends in the project delivery costs for the projects in the 80th percentile subset of TCC follow that of the projects in the full range of TCC. As expected based upon the agencies' practical experience, project delivery costs are higher for projects that fall in the 80th percentile subset of TCC.

2. Project Delivery percentages vary from year to year based on the selection and the composition of the projects in the database.
3. Total excludes projects delivered by alternative delivery mechanisms such as a design-build, JOC, and CM@Risk. Projects delivered by alternative techniques are retained in the database but not analyzed. These projects are not included in the projects selected for analysis in the Study.
Consultant Usage Analysis

Project delivery performance and consultant usage by agency are presented in Table 3-8. The table indicates that on average, 62 percent of the design work and 79 percent of the construction management efforts are completed in-house by the participating agencies. Consultants account for approximately 30 percent of the total project delivery costs while in-house efforts by the participating agencies accounts for the remaining 70 percent of the project delivery costs. From the available data, a clear relationship between the level of in-house effort and project delivery costs cannot be established.

</tbody>
</table>

Notes:
1. In-House and Consultant costs are expressed as percentages of total agency Design, CM (Construction Management), and PD (Project Delivery) costs.
2. TCC = Total Construction Cost
3. Design, CM, and PD costs are expressed as percentages of TCC and are unweighted, arithmetic averages of projects by agency.
E. REGRESSION ANALYSES RESULTS

During Update 2008, several changes were made to improve the modeling methodology. These included developing a statistically-sound method for outlier analysis, using a linear trendline regression for modeling project costs relationships, and using the upper and lower bounds of a 95 percent confidence interval to estimate the range of the project delivery percentages. As a result of these improvements, the model relationships could be predicted with a high degree of certainty as compared to previous Study years. As previously indicated, for Update 2009, the modeling methodology was further refined by analyzing the data in two ranges of TCC. Results from the regression analysis methodology are discussed in Appendix B.

In most cases, the results reflect the agencies’ experience with the delivery of capital projects that on a percentage basis projects with lower TCCs are more expensive to deliver than projects with higher TCCs. As seen from Table 3-6 and Table 3-7, all project categories have lower project delivery percentages for the 80th percentile subset of projects than the full range of projects. Model results are presented with statistical significance tests that confirm they are statistically significant.

F. OTHER CONSIDERATIONS

Size of the Database

The size of the project database remains relatively the same for each Study update due to the 5-year rolling window criterion for project completion dates; as new projects are added, old projects are excluded from analyses based on age. The participating agencies are challenged to identify as many completed projects as possible that meet the Study criteria. The benefits of projects delivered via alternative delivery techniques can be quantified by including them for analysis in the project database. However, due to the significant difference in delivery mechanisms, those projects will have to be analyzed separately from the rest of the projects in the database.

BMP Implementation and Project Delivery Costs

Although it is desirable for project delivery costs to decrease as agency efficiencies increase and BMPs are implemented, this can be confounded by other factors that change annually such as project size and construction cost fluctuations.
G. SMALLER PROJECT ANALYSIS

In 2009, the project team decided to differentiate the projects based on the full set of projects and a subset of “smaller cost projects”. It was hypothesized that projects with smaller total construction cost (TCC) will have a higher project delivery percentage due to costs associated with project delivery which are independent of the size of project. These project delivery costs include:

- regulatory requirements (such as CEQA)
- public involvement and outreach
- right of way acquisition
- project alternatives and scope development
- utility agreements and relocations
- bidding costs and procurement of public contracts

In Update 2009, it was decided that the “smaller projects” cutoff limit would be the smallest 80 percent of projects ranked by the TCC for each category of projects. For example, if there were 100 street projects, the 80 least expensive TCC street projects would be included in the smaller projects cutoff. The hypothesis was confirmed, and it was found that the smaller projects typically have about a 3 to 5 percent higher project delivery percentage of TCC than the full set of projects.

In Update 2014, the project team reconsidered the smaller project cutoff limit, especially since the actual project delivery cost for “small projects” was felt to be much greater than that of the 80th percentile subset of projects. Therefore, an analysis was performed to evaluate the project delivery percentage for the projects in the database based on various TCC cost ranges.

Table 3-9 through Table 3-12 show the project delivery percentages for a range of construction costs by project type. In each project type category, the projects were arranged within four to five cost ranges. More than five cost ranges were not developed because more cost ranges lead to a fewer number of projects in each category, allowing the project delivery percentage to be more easily influenced by projects with extreme (either high or low) project delivery percentages. The cost ranges for each project type were developed in Update 2014 to distribute the projects evenly amongst the cost ranges. The cost ranges in subsequent updates have been the same as the cost ranges in Update 2014 to allow for comparison between Study update years.

In discussing the results presented in the tables below, the project team felt that the project delivery percentages shown are more reflective of the actual project delivery costs for small projects and are a useful tool for determining the expected project delivery costs of smaller projects.

Chapter 4
Best Management Practices
At the onset of this Study in 2002, the agencies examined over 100 practices used in project delivery. Included in this Study were a number of practices that the participants did not commonly use at the time, but believed could add value if ultimately implemented as Best Management Practices (BMPs). Each year the agencies look at changes in the industry and reflect on relevant experiences in order to identify new BMPs. Existing BMPs, in some cases, are reworked by the agencies to address specific challenges encountered during implementation. As in the past, agency implementation of these selected practices continues to be tracked during the Study.

A BMP is usually developed to address a specific issue, however, its implementation may affect other elements of project delivery. A BMP that reduces project schedule, for example, may also favorably impact both communication and project costs. While it is not possible to discreetly quantify all the benefits of a given BMP, the participating agencies developed an approach to identify the major benefits associated with each BMP. This was accomplished in Update 2010 Study by assigning a Perceived Value to each BMP. The Agencies continue to identify the perceived value on all new BMPs. The participating agencies judge that each of the BMPs favorably impact one of the following categories:

- Cost
- Schedule
- Quality
- Communication
- Environment
- Customer Service

To identify the predominant Perceived Values associated with each new BMP, the participating agencies vote on which Perceived Values are most applicable for their Agency. The responses are then tabulated. A Perceived Value receiving three or more votes relative to a BMP is considered to be of significance. If a BMP is not shown to have Perceived Value in a certain category, it indicates that the Perceived Value received two or less votes relative to a BMP; it does not mean that a BMP has no benefit to that Perceived Value category. The majority of the BMPs are assigned a Perceived Value of either “cost” or “schedule”, followed by “quality”.
This indicates that majority of the agencies found these “Perceived Values” as most applicable to the adopted BMPs. This indicates that majority of the agencies found these “Perceived Values” as most applicable to the adopted BMPs.

A. PROGRESS ON BEST MANAGEMENT PRACTICE IMPLEMENTATION

BMPs have been included since the Study 2002 report. For Update 2016, the agencies continued to exchange ideas regarding strategies for implementing various BMPs by using networking opportunities during the face-to-face meetings and the online discussion forum. Many Agencies are pursuing the full implementation of the BMPs but have competing priorities such as hiring challenges as a result of prior years' staffing reductions, furloughs, and the management’s increased involvement in resolving budgetary issues. Constraints continue to limit the full implementation of BMPs for some agencies. In those instances, a partially implemented BMP is considered complete by that agency and is noted in Table 4-1. Agencies continue to focus their efforts on adherence to BMPs that have been implemented and judged to provide efficiencies in project delivery processes for participating departments.

The key for the following Table 4-1 is as follows:

**Cities:**

- LA: Los Angeles;
- LB: Long Beach (Port: Port of Long Beach);
- OK: Oakland;
- SC: Sacramento (DT: Dept. of Transportation, DU: Dept. of Utilities),
- SD: San Diego,
- SF: San Francisco,
- SJ: San José

**Level of Implementation:**

- ✓: Implemented,
- PI: Partially implemented,
- NI: No plans to implement at this time,
- TBD: To be determined

The “Ref” column includes a reference number for the item and also includes the year the BMP was added to the Study. If no year is referenced, the item was included in the original 2002 Report.

</tbody>
</table>
| 2.q 2010 | BMP: Receive bids electronically.  
Description: Electronic bidding programs have increased over the last several years. Receiving bids electronically provides a centralized location to store all bid related documents for public access along with ability to increase bidder participation.  
Perceived Value: | ✓ SD |
| 2.r 2011 | BMP: Use of electronic signatures to do direct conversion from CAD to PDF.  
Description: Currently wet signatures on all pages is standard practice. This causes scanned files to be very large electronic files. Use of electronic signatures in all but the cover page will reduce file size and allow for easier distribution.  
Perceived Value: | ✓ SC DT, SC DU, SD |
| 2.s 2011 | BMP: Have awarding authority to approve plans, advertisement and award of contract in one board/council action.  
Description: Combine approval of plans, advertisement and award of contract by the awarding authority into a single action.  
Perceived Value: | ✓ LB, OK, SC DU |

**Notes:**
- SC DT: City Council approval is not required to advertise.  
- SD: Part of the CIP streamlining, city council approval is obtained once a year on a list of projects to be awarded as a part of the annual budget hearing.  
- SF: We have sole award authority without a council or board.  
- SJ: The Director of Public Works approves all plans and advertisements; also generally awards contracts $1M or less.
### Design

<table>

</thead>
</table>
|          | BMP: Lessen time period between design completion and issuance of notice to proceed. Examples include items such as:  
- Pre-qualification of contractors  
- Good Faith Effort submitted on-line  
- Submittal incentives (i.e., award and material submittals allowed 30 day period; every day early is added to construction contract duration)  
- Have ability to issue contracts within your department  
- Electronic proposal documents provided 48 hours after bid opening; hard copy provided at bid time  
- Contractor’s self-certification  
Description: Implementation of new practices such as using an electronic process or pre-qualification in an effort to reduce the overall timeframe from design completion to notice to proceed.  
Perceived Value: | ✓ 
LA, SJ  
SD: Has an established contractor pre-qualification program |
|          | PI | OK, SC DT |
|          | TBD | SC DU  
LB: Contractor pre-qualification program  
SF: For some CMGC contracts, we prequalify contractors and give incentives for early construction. |

### Quality Assurance / Quality Control

Description: Standardized procedures streamline project design, bidding, and construction processes. Standardized design management procedures will reduce scope creep and delays in construction document preparation. During construction, standard procedures will reduce response times on RFIs, and add overall clarity and efficiency to the construction management process. Having a standard manual will also reduce the time necessary for project documentation training.  
Perceived Value: | ✓ 
LA, SC DT, SF, SD  
SC DU, OK: Needs updating. |
|        | PI | SJ  
LB: Staffing cuts have delayed completion. PM manual is 4 years old; will be updated to include CM & Design standards. |

| 3.II.b. | BMP: Perform a formal Value Engineering Study for projects larger than $1 million.  
Description: Value Engineering identifies life cycle costs of design elements included in a project and certain alternatives. While the cost of the value engineering process may initially add costs to project delivery, overall project costs will be reduced.  
Perceived Value: | ✓ 
LA, LB, SC DT, SC DU, SD, SF: As needed. |

## Cat. Ref:*

### Construction Management

#### 4.I.m.

**BMP:** Classify types of change orders.

**Description:** Classification of change orders into categories such as changed conditions, unforeseen conditions, owner requests, or design changes for owner use improves understanding of the project and lessons learned from the data may improve project delivery on similar projects.

**Perceived Value:**

- LB, OK, SC DT, SC DU, SD, SF, SJ, LA

#### 4.II.a.

**BMP:** Include a formal Dispute Resolution Procedure in all contract agreements.

**Description:** Construction is acknowledged as a dispute prone industry. As such, it makes sense to provide options in the contract documents to avoid litigation and to expedite disputes resolution using alternatives to litigation.

**Perceived Value:**

- LA, OK, SC DT, SC DU, SD, SF SJ: For projects > $10 M
- NI
- LB: City Attorney will not allow this language in project specifications.

#### 4.III.a.

**BMP:** Use a team building process for projects greater than $5 million.

**Description:** Partnering is a team-building process that has a proven record of improving working relationships and production, and reducing claims and disputes on construction projects. It is one of several team-building processes that should be used in the interest of reducing conflict and facilitating project delivery.

**Perceived Value:**

- OK, SC DT, SF
- LA, LB, SC DU, SD: As-needed.
- SJ: For projects > $10M.

#### 4.IV.a.

**BMP:** Involve the Construction Management Team prior to completion of design.

**Description:** Experienced contractors and construction managers should be included in the design process to make designs more constructible and lower cost. Construction managers and contractors are frequently more experienced about the products and/or equipment as well as construction methods that are readily available. Their contributions to selections and decisions during the design process will facilitate construction procurement, means and methods.

**Perceived Value:**

- LA, LB, OK, SC DT, SC DU, SF, SJ
- SD: Always request a constructability review service from the CM team on all projects.

Chapter 5
Online Discussion Forum
As in previous years, the ability to share issues or concerns continues to be one of the Study benefits most appreciated by the participating agencies. Information exchange occurs in a web based forum which provides an avenue to receive input from fellow team members. A total of six topics/questions were discussed during Update 2016. From this set of discussions, the following four topics are presented as an example of the types of information exchanges that occurred within the Update 2016 Online Discussion Forum:

- Infrastructure Asset Management Survey
- Slurry Seal Materials
- Municipal Streets
- Detectable Warning Tiles

Additional information regarding each topic is presented below.

**A. INFRASTRUCTURE ASSET MANAGEMENT SURVEY**

The City of San Diego requested the participation of the other agencies in its brief survey of large U.S. cities on Infrastructure Asset Management. City of San Diego will use this information to develop a summary report that will be shared with all participating cities/counties.

A link to the survey was provided.

**B. SLURRY SEAL MATERIALS**

The City of San Diego asked a few questions regarding slurry seal projects.

1. Does your agency procure its own materials or do the contractors provide them?
2. What type of contracting do you do?
3. Do you use sole-source contracts? If so, with whom?
4. Have you done any life-cycle cost analyses to determine whether RPMS or CM-REAS is better?

Responses were received from four agencies and the detailed responses can be found in Table 5-1.
Table 5-1

C. MUNICIPAL STREETS

The City of San Diego is interested if your City has a procedure on how municipal streets are prioritized and selected for road repairs (slurry and overlay)?

**City of San Francisco response:**

The City develops a yearly priority list of candidates cross referenced to the five-year Excavation Plan. This plan is a schedule of anticipated street excavations coordinated through monthly meetings of the Committee of Utility Liaison Coordination of Projects (CULCOP). The CULCOP meetings bring City agencies together with private utilities to present projects, discuss conflicts, and coordinate joint opportunities. This synchronization improves the planning process, minimizes disruption to the neighborhood and public transit, and protects newly repaved roadways from being cut into. Through the five-year plan, the City imposes a five-year moratorium on
excavation by utility companies and other agencies on newly resurfaced streets.

Once a street is cleared for all public and private utility work, the City can determine the type of treatment needed and program the street for paving. Repairs are implemented along contiguous blocks to ensure cost efficiency.

The street repaving program prioritizes projects using the following criteria:

**Multi-modal Routes**

Project lists are divided and categorized by the mode of traffic it carries (Muni routes, bicycle routes, Muni and bicycle routes, or a non-Muni/bicycle route). Streets with high volumes of transit and bicycle traffic receive priority for consideration. The City collaborates with other agencies and community organizations to determine how routes within the bike network are selected and prioritized.

**PCI Score**

The Pavement Management and Mapping System (PMMS) generates a list of accepted streets that have a Pavement Condition Index (PCI) scores of 84 and below. These streets are then categorized as either requiring preservation treatment (PCI 64 to 84), or requiring pavement renovation/resurfacing or reconstruction (PCI 63 and below).

**Functional Classification**

The list of streets generated by PMMS are divided by treatment type: a) preservation and b) pavement renovation, and are then sorted by mode and functional classification. Functional classification includes arterials and collectors which carry heavy to moderate bike, car, and transit traffic in and around the City; while local streets carry low volume residential traffic.

**Project Readiness/Coordination with Utility Companies and City Agencies**

Project readiness is primarily dependent upon utility clearances. If a paving project is being coordinated with another agency, the project relies upon the schedule of each varied element. Priority is given to projects with utility clearances. The projects jointly coordinated with other agencies must synchronize with the paving project schedule.

**Equitable Distribution Across the City**

Geographic equity is monitored to ensure that paving projects are distributed to all parts of the City. Based on the estimated number of street segments to be paved, each of the City’s neighborhoods and commercial districts will receive an equitable distribution over a five year rolling duration. The distribution is based on the functional class inventory and PCI score as it relates to the overall city network.

**Community Priorities**

When the City receives complaints from the public regarding paving issues, engineers follow a protocol to investigate, evaluate, and make recommendations. If the street is found to be in need of repaving and meets requirements for a paving candidate, priority for resurfacing is considered. The street is verified against the Five-year Plan for conflicts and/or joint opportunities. If there are no utility conflicts, the street may be programmed for the earliest available paving date.

**City of Sacramento response:**

The City of Sacramento is responsible for over 3,000 lane miles of streets. The City develops a 5-year resurfacing plan to
maintain these streets with the anticipated budget. The method of selecting streets that are placed on this resurfacing plan are twofold:

1. The City uses a Pavement Management System (PMS) to run a multi-year budget analysis. The results of this analysis are viewed spatially using ArcMap to view and organize the block-to-block street sections by geographic area. The block-to-block street sections are grouped into longer contiguous street segments within general neighborhood areas. These segments are then prioritized by cost effectiveness and placed on the potential resurfacing list. Once the resurfacing list is created, it is cross referenced with Department of Utilities (DOU) CIP water main projects.

2. Sacramento Public Works coordinates with DOU and follows DOU CIP water main retrofit projects. DOU have many projects throughout the city where they are replacing aging water mains and laterals. Public Works waits until DOU has completed a neighborhood, and then schedules the neighborhood for resurfacing.

The PMS (Micropaver) identifies and prioritizes which streets are eligible for slurry, resurfacing, or other type of repairs. Segments that have been identified for work either by our Utility Notification System or our Public Way Reservation System (Permits) are removed from the PMS list. From the revised PMS list, the fiscal year’s street repair program is determined, subject to availability of funds. The segments that do not make that fiscal year’s program are automatically relisted to the following fiscal year(s) program until the maintenance is ultimately applied.

The City of San José Response:

The City of San José consists of 4,300 lane miles of streets. The City’s network is divided into three different categories: Priority Street Network (PSN) (consisting of arterial or major streets), Other Major Streets (OMS) (consisting of collector streets), and Residential streets. The City currently funds the maintenance of PSN and OMS streets, while Residential streets are only funded for stop gap measures, including pothole repair and stamp patch repair.

The City annually updates a 3-year plan to maintain the major streets within the budget anticipated for each year. Streets that are in need of sealing (PCI of 50-70) or resurfacing (PCI of 26-49) are highly prioritized. The City then selects each street based on the following methods and/or criteria:

1. The City uses the PMS “StreetSaver” to run a multi-year budget-constraint scenario that optimizes the street selection for the entire network while considering the optimum split
between preservation versus rehabilitation. The results of this analysis are reviewed and streets are selected based on the functional class, time since last treatment, PCI, and cost of treatment. Each segment selected by the report and its adjacent segments are reviewed and field-verified for both contiguous segmentation and construction efficiency and constructability. Once the 3-year list is developed, it is posted to the City’s Pavement Coordination Website (https://sjcdot.knack.com/project--street-conflicts#home/) for stakeholders’ review and comments.

2. Streets that are selected for resurfacing based on the PCI threshold are further evaluated by the City for structural design, pavement performance, and ride quality using nondestructive deflection testing. Street repair methods include both conventional and innovative technologies such as rubberized hot mix asphalt, cold-in-place recycling, and thinlays.

3. The City considers community priorities by reviewing frequently reported maintenance issues related to the pavement condition. The City staff investigates these streets and recommends the necessary treatment, and, if no project conflicts are found, these streets are incorporated into the 3-year plan.

4. Multi-modal routes (i.e. bike lanes, minor safety improvements, and green pavement enhancement) are also prioritized when planning and implementing pavement projects. The pavement maintenance team collaborates closely with the transportation team to identify any segments that need pavement maintenance and new bike lanes or enhancement of the current bike lanes.

**Port of Long Beach Response:**

The Design Division performs road condition surveys every three years to determine the Pavement Condition Index. The Design Division then prioritizes projects for the capital program based on the PCI, with a minimum acceptable PCI of 65.

**D. DETECTABLE WARNING TILES**

The City of San Diego presented a few questions about detectable warning tiles.

1. What is the standard color of detectable warning tiles for your curb ramps?

2. Do you allow other colors aside from your standard color? If so, what color(s)?

3. If yes, what situations/condition will you allow a deviation from your standard color?

4. If you allow the deviation, do you require the applicant to provide a visual contrast test?

Responses were received from four agencies and are recorded in Table 5-2.
### Table 5-2
**Responses to Detectable Warning Tiles Questions**

<table>
<thead>
<tr>
<th>Questions</th>
<th>What is the standard color of detectable warning tiles for your curb ramps?</th>
<th>What type of contracting do you do?</th>

(1) Agency costs include other direct costs and can be listed underneath. This value is locked and it is calculated from its items (Rows 15 - 19).
APPENDIX B
PERFORMANCE CURVES
REGRESSION ANALYSIS RESULTS
The results of the regression analysis performed using the performance model are presented in the following paragraphs.

REGRESSION DEFINITIONS
A brief overview of the relevant statistical terminology and their definitions is provided in the following paragraphs:

Performance curves produced for this Study are regressions of data, demonstrating how close of a relationship exists between the dependent variable (on the y-axis) and the independent variable (on the x-axis). For instance, a regression curve of design cost versus total construction cost (TCC) would be prepared to evaluate how much of the variability in design cost is due to the TCC value.

The regression trendline can be used as a starting point for evaluating the budget for a suite of projects. Caution and use of professional judgment is required if using the regression trendline to budget an individual project.

Confidence Interval
The upper and lower bounds of the confidence interval indicates the level of certainty in a data set and how likely it is that a random sample from the data set will fall within the interval. The wider the distance between the upper and lower bounds of a confidence interval, the less certainty in the model and greater the need to collect more data before drawing conclusions from the data set.

Coefficient of Determination
A best-fit logarithmic curve is calculated using the least-squares method in Excel®, and a $R^2$ value is displayed. The $R^2$ value, also called the coefficient of determination, is a value between 1 and 0, with a value approaching 0 indicating a poor model and a value approaching 1 indicating a high dependence of the y-value statistic on the x-value statistic.

Statistical Significance
To evaluate the statistical significance of the result obtained, the regression analyses included a calculation of p-values. Whereas the $R^2$ value is a descriptive statistic (i.e., describes the current set of data), the p-value is a predictive statistic. It indicates whether there are enough data points to arrive at statistically-significant results and whether the data set could be used to forecast new values. The selection of a desirable p-value is subjective, though 0.10 or 0.05 is typically used as the maximum desirable value.

For the purposes of this Study, a critical p-value of 0.10 was selected. Thus, any result where $p \leq 0.10$ is considered statistically significant. There is no difference between a p-value slightly below 0.10 as one that is far below 0.10. Both results are considered to have equal statistical significance.
For regressions resulting in a p-value above 0.10, additional projects should be added to the database to improve the result. Please see the Study 2002 report for additional detail on the connection between the number of projects and p-values. Pump stations and restroom projects had p-values less than 0.1, and therefore the values obtained are not statistically significant.

For each of the regressions, the $R^2$ value and p-value should be considered separately. A high $R^2$ value does not mean the result is statistically-significant, and vice-versa.

The results of the regression analyses are discussed in the remainder of this section. The results of the regression analyses are summarized in Table B-1 and Table B-2. Table B-1 summarizes the performance model results for the full range of TCC while Table B-2 summarizes the results for the 80th percentile subset of TCC. These tables also summarize the design, construction management, and project delivery costs expressed as a percentage of the TCC and the $R^2$ and the p-values for the different project types.

It is important to note that while the slopes of the linear regression models are an expression of the project delivery cost as a percentage of construction, the slopes are not equal to the average and median project delivery percentages shown in Table 3-5, Table 3-6 and Table 3-7. This is due to the fact that the linear trendline is fit by the least squares method.

This is better explained by the following example. Consider 5 projects in the municipal category having the $a_1$, $a_2$, $a_3$, $a_4$, and $a_5$ as their individual project delivery costs and $b_1$, $b_2$, $b_3$, $b_4$, and $b_5$ as their individual TCC. The arithmetic average of the project delivery percentages would be represented as:

$$\text{Project Delivery Percentage} = \frac{a_1 + a_2 + a_3 + a_4 + a_5}{b_1 + b_2 + b_3 + b_4 + b_5}$$

The project delivery percentages presented in Table 3-5 through Table 3-12 are computed using the above formula which is the average of the individual project delivery percentages.

In the regression analysis, the project delivery percentage is computed in fashion that is more similar to the following formula which represents the average slope of the least squares fit.

$$\text{Project Delivery Percentage} = \frac{a_1 + a_2 + a_3 + a_4 + a_5}{b_1 + b_2 + b_3 + b_4 + b_5}$$

The project delivery percentages presented in Table B-1 and Table B-2 are computed using the above formula.

The plots depicting the regression relationships are shown in this section. It should also be noted that while majority of projects are clustered near the origin of the graph, the slope of the trendline is predominantly governed by the data points scattered at relatively high TCC values.
Since the slope of the trendline provides the design, construction management, or the project delivery costs as a percentage of the TCC for a group of projects, the results better reflect the properties of a program of projects rather than that of an individual project. Therefore, the reader must avoid budgeting individual projects based solely on these analyses.

In most cases, the results reflect the agencies’ experience with the delivery of capital projects that on a percentage basis projects with lower TCCs are more expensive to deliver than projects with higher TCCs. Only 2 out of the 16 categories (bridges and pump stations) have lower project delivery percentages for the 80th percentile subset of projects than the full range of projects. It is concluded that the model results are reasonable from a statistical perspective.

For projects belonging to the Parks category, there is an increase of approximately six percent in the project delivery percentages for projects evaluated in the 80th percentile subset of TCC. Similarly, project delivery percentages for projects belonging to the Pipes, Streets and Municipal category exhibit an 11, 13, and 23 percent increase, respectively, than the 80th percentile subset. Comparing the results summarized in Table B-1 and Table B-2 shows that an economy of scale exists in delivering projects with a higher TCC versus those with a lower TCC.

The elimination of auto-correlation in Update 2008 and the use of the linear trendline to describe the relationship between project delivery costs and the TCC have significantly improved the $R^2$ values as compared to the Study years prior to 2008. The linear regression trendline equations are shown in Table B-3.

The reader is cautioned that these tables should only be used as a reference and not for prediction of performance. Readers are urged to review the curves in this section in conjunction with using this table.

Notes:

TCC = Total Construction Cost; CI = Confidence Interval. The project delivery percentages indicated are the ranges corresponding to the 95 percent confidence intervals on the mean slope of the linear regression trendline. Caution and review of the report text are urged in using this information. Refer to Appendix B for the corresponding regression curves, R² values, and N values for more details.

1. Total excludes projects delivered by alternative delivery mechanisms such as design-build, JOC, and CM@Risk. Projects delivered by alternative techniques are retained in the database but not analyzed. These projects are not included in the projects selected for analysis in the Study.

</tbody>
</table>

Notes:
1. This value may be different from the sum of overhead values since the compounding formula may vary by agency.
2. The City of Long Beach is currently in the process of recomputing its overhead rates. Rates shown in the above table are 2012 rates.
3. Based on averages of all Bureau program overhead rates provided under CAP 37.
4. All costs are captured independently of funding source.
