Application and Design

ESJ-202 is a weather louver designed to protect air intake and exhaust openings in building exterior walls. Design incorporates J style blades, sloped sill and high free area to provide maximum resistance to rain and weather while providing minimum resistance to airflow. The ESJ-202 is an extremely efficient louver with AMCA LICENSED PERFORMANCE DATA enabling designers to select and apply with confidence.

Standard Construction

Frame ........ Heavy gauge extruded 6063-T5 aluminum, 2 in. x 0.063 in. nominal wall thickness

Blades .......... J style, heavy gauge extruded 6063-T5 aluminum, 0.063 in. nominal wall thickness, positioned at 45° angles on approximately 3 in. centers

Construction .... Mechanically fastened

Birdscreen ......... 3/4 in. x 0.051 in. flattened expanded aluminum in removable frame, inside mount (rear)

Finish ........ Mill

Minimum Size .... 6 in. W x 6 in. H

Maximum Single Section Size .... 120 in. W or 120 in. H. (limited to 70 ft. sq.)

Options (at additional cost)

- A variety of bird and insect screens
- Blank off panel
- Clip angles
- Extended sill
- Filter rack
- Flanged frame
- Glazing adaptor
- Hinged frame
- Security bars
- Welded construction
- A variety of architectural finishes including:
  - Clear anodize
  - Integral color anodize
  - Baked enamel paint
  - Kynar paint

*Width and height dimensions furnished approximately ¼ inch under size.
**Free Performance Data**

**ESJ-202**

*Stationary Louver J Blade Extruded Aluminum*

---

### Water Penetration (Standard Air - .075 lb/ft²)

**Test size 48 in. x 48 in. Test duration of 15 min.**

---

### Airflow Resistance (Standard Air - .075 lb/ft²)

Model ESJ-202 resistance to airflow (pressure drop) varies depending on louver application (air intake or air exhaust). Free area velocities (shown) are higher than average velocity through the overall louver size. See louver selection information.

---

The AMCA Water Penetration Test provides a method for comparing various louver models and designs as to their efficiency in resisting the penetration of rainfall under specific laboratory test conditions. The beginning point of water penetration is defined as that velocity where the water penetration curve projects through .01 oz. of water (penetration) per sq. ft. of louver free area. **The beginning point of water penetration for Model ESJ-202 is 668 fpm free area velocity.** These performance ratings do not guarantee a louver to be weatherproof or stormproof and should be used in combination with other factors including good engineering judgement in selecting louvers.
Maximum single section size for model ESJ-202 is 120 in. W x 84 in. H or 84 in. W x 120 in. H (70 sq. ft.). Larger openings require field assembly of multiple louver panels to make up the overall opening size. Individual louver panels are designed to withstand a 25 PSF wind-load (please consult Greenheck if the louvers must withstand higher wind-loads). Structural reinforcing members may be required to adequately support and install multiple louver panels within a large opening. Structural reinforcing members along with any associated installation hardware is not provided by Greenheck unless indicated otherwise by Greenheck. Additional information on louver installation may be found in AMCA Publication #501, Louver Application Manual.

**Minimum Single Section Size**
- 6 in. W x 6 in. H

**Maximum Single Section Size**
- 70 ft. sq.
## Finishes
